

Memo

From David Poulton, Environmental Noise Solutions Limited
To Donald Graham
Subject Proposed Residential Development, Land off Shaw Lane, Carlton
Date 04 May 2016

Donald

An additional noise survey of the site at has been performed at the land at Shaw Lane, Carlton (overnight on the 25/26 April 2016) to address the recently raised noise concerns of the LPA.

Ambient noise levels at the proposed façade of the closest dwelling house to the factory to the south were 49dB LAeq (8-hour) during the night time and 54-56 dB LAeq during the daytime hours of the survey.

These noise levels are wholly comparable to the measured noise levels of the original noise survey (with the ACTUAL measured full 8-hour equivalent night time level being 3dB below the level used in our original report).

Our formal report detailing the full findings of the new noise survey and the detailed acoustic design requirements for the scheme(unchanged) is to follow but **our conclusion at this stage, having completed the additional noise survey works and reviewed the noise data gathered, is that noise should not be a determining factor when considering and granting planning approval for the proposed residential development and our original scheme of noise mitigation remains unchanged.**

I trust that the above meets with your requirements; please do not hesitate to contact me if you require any further information.

Best Regards

Dave Poulton
