

Swift boxes should be installed two to four metres above ground and should offer unobstructed fly-in access. The boxes should face between north and east, avoiding full sun and prevailing wind. They should be installed on the elevation as indicated on the plan, away from windows and doors.

Brash and log piles should be created from any vegetation clearance undertaken during the Site clearance phase. A total of six brash and log piles will be created and will be positioned as indicated. The brash and log piles should contain a mix of both logs and brash, a range of different sized logs including thickness and length, the central core compacted, while the outer layers are looser providing gaps for species to shelter within and measure at least 1m by 1m in size and at least 0.5m high. These brash and log piles will not require any maintenance but should be checked on a yearly basis and 'topped up' when required.

Key:

- Bat box
- Brash pile
- Bee brick
- Hedgehog hole
- Swift box

A hedgehog 'highway' will be created within the new development to facilitate movement of this species. The following will be created across the development in the locations as indicated:

- New garden fences will have 13cm by 13cm holes cut into the bases, which will include holes within any gravel boards. The following will feature as part of the hedgehog 'highway'.
- Where possible fences and gates will be raised off the ground, to provide a 10-13mm gap for hedgehogs or have suitable holes cut into them.
- Native hedgerows and planting will be created where possible along boundaries to allow access through areas for hedgehogs.

The integrated bat boxes should be positioned as close to the eaves as possible and should face south to southwest away from artificial lighting with flight paths to the entrance unobstructed, wherever possible. The boxes should be installed in locations where the flight paths to the entrances are unobstructed and be situated at least 3m to 5m from ground level, away from any light sources.
