1. INTRODUCTION.

1.1. There are plans for the development of the house and land to the rear of 26 Cross Lane Royston, Barnsley.

1.2. Whitcher Wildlife Ltd has been commissioned to carry out an ecology survey of the site to establish whether there are any issues that may affect the proposed works.

1.3. The site survey was carried out on 20th February 2012 and this report outlines the findings of that survey and makes appropriate recommendations.

1.4. Appendices I to IV of this report provide additional information on specific species and are designed to assist the reader to understand the contents of this report.

****

2. SURVEY METHODOLOGY.

2.1. Prior to visiting the site the survey area was cross referenced to maps and aerial photographs to give a general idea of the habitats within the area and to identify potential access and walking routes.

2.2. The survey area and immediate surrounding area was thoroughly searched for evidence of badger (Meles meles) activity by looking for the following signs in line with Harris S, Cresswell P and Jefferies D (1989). *Surveying Badgers*. Mammal Society:-

* Badger setts.
* Badger latrines or dung pits.
* Badger snuffle holes and evidence of foraging.
* Badger paths.
* Badger prints in areas of soft mud.
* Badger hairs caught on fencing.

2.3. All watercourses within the survey area and for approximately 50m in each direction were thoroughly searched for evidence of water vole (Arvicola terrestris) activity by looking for the following signs, in line with the guidance in the Water Vole Handbook:-

* Water vole burrows.
* Water vole faeces and latrines.
* Water vole feeding stations.
* Water vole runs.
* Water vole prints in areas of soft mud.
* Water vole lawns.
* Predator field signs.

2.4. All watercourses within the survey area and for approximately 100m in each direction were thoroughly searched for evidence of otter (lutra lutra) activity by looking for the following signs in line with the National Rivers Authority guidelines:-

* Otter prints in soft mud.
* Otter spraints.
* Otter Holts.

2.5. All mature trees and derelict buildings were checked for potential bat roosting sites in line with the Bat Conservation Trust, Good Practice Guidelines by looking for the following signs:-

* Holes, cracks or crevices.
* Bat Droppings.

2.6. The land adjacent to the survey area was assessed for bat roosting and foraging potential including connective routes and flight lines.

2.7. The area within 500m of the survey site was cross referenced to maps to highlight all ponds close to the site. Where possible the ponds were accessed using agreed access or public rights of way to assess the potential for great crested newts (*Triturus cristatus*) to be present.

2.8. All watercourses and waterbodies within the survey area and for approximately 50m in each direction were thoroughly searched for the presence of crayfish where safe to enter the water. The survey was carried out in accordance with the Conserving Natural 2000 Rivers Monitoring Series No 1, Protocol for Monitoring the White Clawed Crayfish.

2.9. The survey area was thoroughly searched for the presence of reptiles or suitable reptile habitats.

2.10. All surveys were carried out in line with the IEEM survey standards and advice.

2.11. This survey was carried out by Stephen Lingwood. Since January 2009 Stephen has had experience in a professional capacity as a Wildlife Consultant carrying out Ecology Surveys and Phase 1 Habitat surveys. He is also an affiliate member of IEEM and has successfully completed a number of courses run by IEEM, BCT and FSC in the relative protected species and in carrying out Phase 1 Habitat surveys.

****

3. SURVEY RESULTS.

3.1. Data Search Results.

3.1.1. Barnsley Biological Records Centre was consulted for records of protected species within the survey area and the surrounding area.

3.1.2. Barnsley Biological Records Centre hold records of water vole and large numbers of bird within a 1km radius of the site. Full data search results are shown in Appendix V of this report.

3.1.3. A desktop data search for existing records of protected species within the area of the site was also carried out using the National Biodiversity Network (NBN) Gateway.

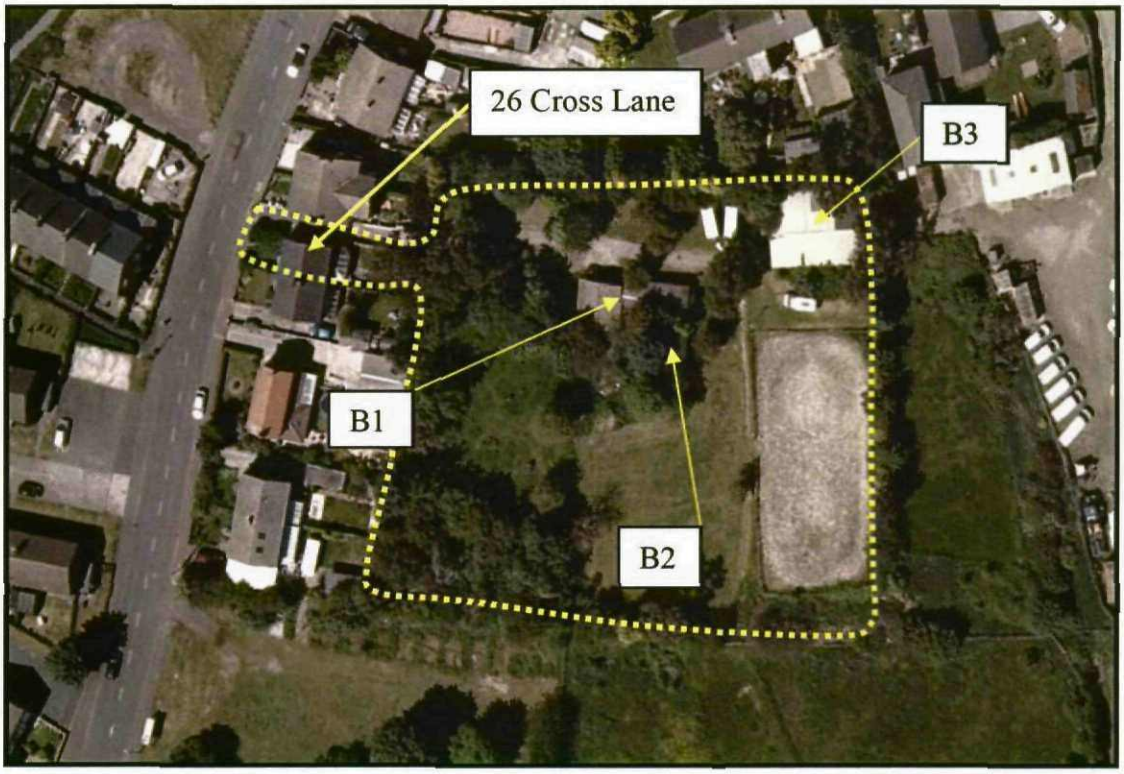

3.1.4. The NBN Gateway holds records of great crested newts, badgers and bats within 10km of the surveyed site. None of these were site spacific.

3.1.5. The MAGIC website was consulted for records of protected sites within the survey area. There are no protected sites within the survey area.

3.16. The Rabbit Ings Country Park to the east of the site holds records of a number of protected species including water vole and great crested newts.

3.2. The Surveyed Area.

3.2.1. The survey carried out was of 26 Cross Lane and the land to the rear of the property, as shown in the aerial photograph below.

3.2.2. The area surrounding the survey comprises large areas of residential dwellings to the west with large areas of reclaimed grassland and Royston coke plant to the east.

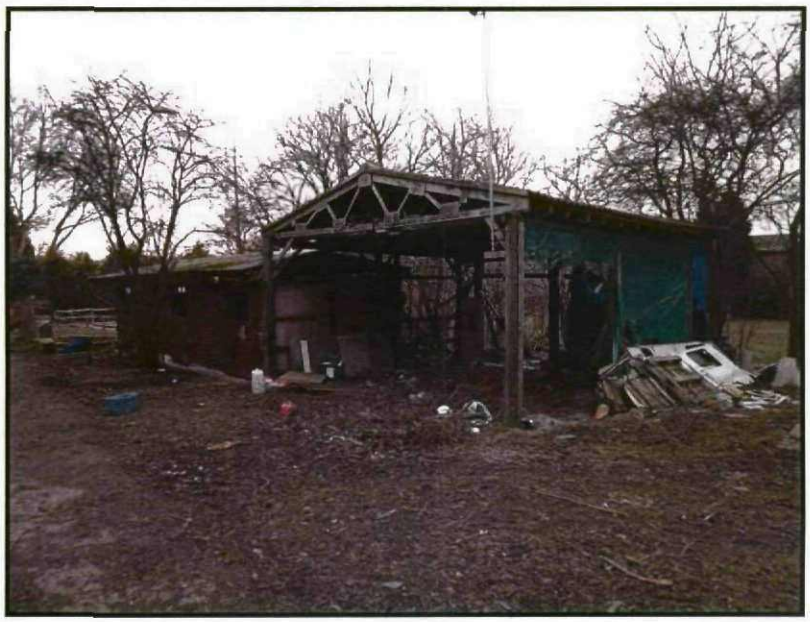

3.2.3. 26 Cross Lane is a two storey semi detached dwelling with a large area of land to the rear. The building comprises a brick and block built structure with a cavity wall, the roof has a covering of blue slates with no felt lining inside, the roof timbers are of purlin and rafter construction. The building is generally in good condition with only small amounts of mortar missing between the brickwork.

3.2.4. The land to the rear of the dwelling was found to have 3 buildings formally used as stables and a workshop.

3.2.4.1. Building 1 is a small 3 part timber built stable with cement based corrugated roof sheets. The stable has had an open timber barn constructed on the western aspect.

3.2.5. The vegetation within the surveyed area comprises mature fruit trees, hawthorn, eucalyptus, bramble and scrub grassland heavily grazed by horses. To the east of the site a large horse arena has been erected.

3.3. Survey Results.

3.3.1. No badger setts or badger field signs were identified within the survey area.

3.3.2. Part of the disused Barnsley Canal was identified approximately 60m to the west of the surveyed site. Although large areas of the canal are found to have little or no water there are areas that appear to contain permanent water.

3.2.4.2. Building 2 is a small brick built stable comprising single skin brick and block walls, concrete roof and ridge tiles and a layer of roof felt between the rafter and purlin roof structure and the tiles.

3.2.4.3. Building 3 is a large open fronted timber and corrugated steel built structure, the building has a small workshop internally built to the rear with the rest of the building being used to house horses.

HABITAT SUITABILITY INDEX SCORES.

Cross Lane Royston. Canal

HSI		Pond 1
SI_1	Location	0.5
SI_2	Pond Area	0.8
SI_3	Pond Drying	1.0
SI_4	Water Quality	0.67
SI_5	Shade	1
SI_6	Fowl	0.67
SI_7	Fish	0.01
SI_8	Ponds	1
SI_9	Terrestrial Habitat	0.67
SI_{10}	Macrophytes	1
Total score		0.72
Presence		Good

3.3.3. One pond was identified within 500m of the survey area. This pond is situated to the south east of the site within Rabbit Ings Country Park. Access could not be gained to this pond during the survey.

3.3.4. The house surveyed within the site was found to be in good condition with very little bat roosting opportunities. The main roof structure was found to be in good condition with no broken or missing slates, all fascia boards were found to be tight up to the wall and no gaps or cracks within the ridge.
3.3.5. No bat roosting potential was identified within any of the buildings to the rear of the house.

3.3.6. No trees with features suitable for roosting bats were located within the survey area. Although no bat field signs were identified the surveyed land will provide good foraging habitat for different species of bats. A thorough assessment of bat foraging activity around the site could not be carried out during a daytime survey of the site.

3.3.7. No Schedule 9 invasive plant species, or any other invasive or harmful plant species, were located within the survey area.

3.3.8. The vegetation and out buildings within the surveyed area will provide potential nesting habitat for many bird species throughout the nesting bird season.

3.3.7. Small amounts of the debris located within the surveyed site present potentially suitable reptile refugia. No reptiles were identified during this survey.

4. EVALUATION OF FINDINGS.

4.1. No bat field signs or bat roosting potential were identified within the roof space of the main building or around the external features of the building. Therefore the proposed works to the main building will not have an impact on roosting bats.

4.2. The buildings to the rear of the site were found to be in poor condition with no windows doors and parts of the roofs missing. No bat field signs were identified within the out buildings, these buildings were assessed to have very little potential for roosting or hibernating bats.

4.3. There are no site specific records of great crested newt within this stretch of the canal but it is known there are records within 10k of the site.

4.4. One pond was identified approximately 400m to the east of the site this is within the recently formed Rabbit Ings Country Park. It is known there are records of great crested newts within the park. This pond was not surveyed due to access problems.

4.5. Due to the proximity of the site to the Barnsley Canal and the pond within Rabbit Ings Country Park the site may provide a suitable great crested newt habitat. The proposed works will potentially have a high impact on great crested newts if they are present on the site.

4.6. The buildings to the rear of the site were all found to be in poor condition with the roofs deteriorating with doors and windows missing, this will create habitat for small bird species.

4.7. The vegetation within the surveyed site is ideal for nesting birds within the nesting bird season, which extends from March to September each year.

4.8. If works to the buildings or vegetation are carried out during the nesting season they will potentially have a high impact on any birds nesting within the site.

4.9. All works conducted within areas of grassland and refugia have the potential to impact on reptiles present on the site.

****

5. RECOMMENDATIONS.

5.1. As there are records of great crested newts within 1k of the site within Rabbit Ings Country Park, further survey work is recommended to assess the presence of Great Crested Newts within the survey area and the impact of the proposed works. Indications suggest that a great crested newt license will be required for any work at this location.

5.2. Great crested newt surveys can only be carried out between mid March and mid June each year. A total of four surveys are required and two of these surveys must be carried out between mid April and mid May. If no great crested newts are found in the first four surveys then there is no need to carry out the final two surveys. This is a small window in which to carry out the surveys and if it is missed nothing can be done until the following year.

5.3. It is recommended that any vegetation clearance is done outside the nesting bird season which runs from the beginning of March to the end of September each year. If any vegetation clearance is to be carried out during the nesting bird season it must be immediately preceded by a nesting bird survey. Any nests identified during this survey must be left undisturbed until the young have fledged.

5.4. It is recommended that site personnel are briefed as to the potential presence reptiles within the work site and how to identify reptiles if discovered. A toolbox talk is included in Appendix VI of this report. If any reptiles are discovered during works then they should be allowed to move away to safety. If large numbers of reptiles are identified during the works, they should be protected from harm and the author of this report should be contacted.

****

Stephen Lingwood.
02.03.2012.

Appendix I.

BACKGROUND GREAT CRESTED NEWT INFORMATION.

The great crested newt population has suffered a major decline in Britain over the last century. Numerous ponds have been lost, unmanaged ponds have become silted up and over-shaded, development has destroyed ponds and associated terrestrial habitat and caused fragmentation of populations. The loss of grassland, scrub and woodland has resulted in fewer opportunities for foraging, dispersal and hibernation.

The UK Biodiversity Plan (BAP) contains a great crested newt Species Action Plan (SAP) aimed at maintaining its existing range and population status, as well as increasing the number of populations through re-colonisation.

The great crested newt is listed on Schedule 5 of the Wildlife and Countryside Act 1981, recently modified by the Countryside and Rights of Way Act 2000.The great crested newt is therefore subject to the provisions of Schedule 9, which make it an offence to:

- Intentionally kill, injure or take a great crested newt.
- Possess or control any live or dead specimen or anything derived from a great crested newt.
- Intentionally or recklessly damage, destroy or obstruct access to any structure or place used for shelter or protection by a great crested newt.
- Intentionally or recklessly disturb a great crested newt while it is occupying a structure or place, which it uses for that purpose.

The great crested newt is also listed on Annex II and Annex IV of The Conservation (Natural Habitats &c) Regulations 1994. Regulation 39 makes it an offence to:

- Deliberately capture or kill a great crested newt
- Deliberately disturb a great crested newt.
- Deliberately take or destroy the eggs of a great crested newt.
- Damage or destroy a breeding site or resting place of a great crested newt.

The legislation applies to all life stages of great crested newts.

The maximum fine on conviction of offences under Section 9 and Regulation 39 currently stands at £5,000. The CroW Act 2000 amendment also allows for a custodial sentence of up to six months instead of, or in addition to, a fine. In addition, items, which may constitute evidence of the commission of an offence, may be seized and detained.

In order to understand the potential effects of development it is essential to understand a little of the great crested newt ecology.

Great crested newts breed in ponds and other water bodies. They can begin to migrate to their breeding ponds as early as the first frost-free days in late January with the majority reaching their breeding ponds by mid March. Timing will be influenced by a number of factors, mainly evening temperatures above 5C and recent rain.

The peak egg-laying period is from mid-March to mid-May. The newts will lay their eggs individually, mainly on the leaves of submerged plants. The larva hatch after three weeks and then take another 2-3 months to complete larval development. Adult newts generally leave their breeding ponds from late May onwards.

Once the larvae have completed metamorphosis (the transition from aquatic larvae to land-adapted juveniles, called efts), they emerge from the pond. This emergence begins in late August and generally continues until late October. It takes 2-4 years to reach sexual maturity, during which time the newts will be land based.

Adults and immature newts spend the winter in places that afford protection from frost and flooding. This will generally be underground amongst tree roots, in mammal burrows, or under suitable refuges above ground like deadwood or rubble piles. Hibernation may last from October to February.

Whilst on land, outside the hibernation period, great crested newts will forage at night, taking a wide range of invertebrate prey.

From the above, it can be seen that great crested newts spend the majority of their time on land and only visit the ponds for breeding purposes. As a result, surveys need to be timed very carefully. Terrestrial surveys are very inaccurate and the only time that surveys can be truly thorough is in the narrow window of opportunity between March and September.

Great crested newts will travel large distances between ponds and terrestrial refuges. It is recommended that anywhere within 500m of a pond should be treated as potential great crested newt habitat and should be surveyed and evaluated.

An experienced surveyor must carry out the surveys and must be in possession of an appropriate Natural England great crested newt survey licence.

It is essential that great crested newt surveys are planned well in advance of any development and ideally before Planning Consent is sought. Surveys can only be carried out at the appropriate time of year and repeat surveys are essential. The guidelines suggest that between four and six surveys need to be carried out, three of these between mid-March and mid-June.

If great crested newts are to be effected by any development, a thorough assessment of the population is essential followed by the design of a comprehensive mitigation package. Only when this has been done can a licence application be submitted to Natural England for approval. It takes 30 working days for a licence application to be determined and the period of time that mitigation measures take can be measured in months. It is therefore essential to plan well in advance of development commencing.

Appendix II. NESTING BIRD INFORMATION.

It is necessary to understand a little about the legal protection offered to nesting birds in order to evaluate the findings of this report.

Part 1.-(1) Of the Wildlife and Countryside Act 1981states that:-

If any person intentionally:-

(a) kills, injures or takes any wild bird;
(b) takes, damages or destroys the nest of any wild bird while that nest is in use or being built; or
(c) takes or destroys an egg of any wild bird,

he shall be guilty of an offence.

Part 1.-(5) of the Act states that:-

If any person intentionally:-

(a) disturbs any wild bird included in Schedule 1 while it is building a nest or is in, on, or near a nest containing eggs or young; or
(b) disturbs dependant young of such a bird,

he shall be guilty of an offence and liable to a special penalty.

The Countryside and Rights of Way Act 2000 amends the above by inserting after "intentionally" the words "or recklessly".

The nesting season will vary according to the weather each year but generally commences in March, peaks during May and June and continues until September.

It is also worth remembering that some birds nest in trees and scrub but others are ground nesting.

The best way to avoid this issue is to plan for vegetation clearance to be carried out outside the bird-nesting season.

Appendix III.

REPTILES - GRASS SNAKE AND ADDER INFORMATION.

The grass snake (*Natrix natrix*)and the adder (*Vipera berus*)are the two most common snakes to be found in the UK. Adders are found all over Britain while the grass snake becomes rarer towards the north and are rarely found in Scotland.

The grass snake is usually around 120cm long, live in a variety of rough habitats and lay their eggs in warm rotting vegetation. The background colour is dark green and the body is marked with vertical black bars and spots that run along its sides. There is generally a dark collar marking.

The adder is the only native species that is venomous but this is rarely harmful to humans. Adult adders are generally up to 66cm long. Background colouration is a light shade of grey or brown with a black zigzag marking along the length of the back. As with all reptiles, colouration varies and becomes duller as sloughing (skin shedding) approaches.

Both snakes hibernate, spending the winter in burrows or under logs protected from the cold and predators. Maintaining the right body temperature is vital to reptiles' survival. In the morning, they find a warm basking site to heat up their bodies, then later they may move back into the shade because they do not sweat and have to be careful not to overheat. During hot summers, adders will try to move to damper, cooler sites.

Both snakes are protected under schedule 5 of the Wildlife and Countryside Act 1981. They received greater protection following reviews of the schedules published in 1988 and 1991. This means they are protected against intentional or recklessly killing and injuring and against sale or transporting for sale.

Appendix IV. REPTILES - LIZARD INFORMATION.

The common or viviparous lizard (*Lacerta vivipara*) is one of three species of lizard that occur in the UK. They have a dry scaly skin and are variable in colour ranging from brown or yellow-brown to almost green with varying patterns of spots or stripes. The typical length of an adult is 150mm, including the tail.

Common lizards hibernate over the winter, emerging from February onwards depending upon the weather. They begin to mate in April and May and the young are born in late July or August. The lizard gives birth to live young, hence the term viviparous, meaning live bearing.

The lizards draw their body warmth from the sun and consequently spend long periods basking in the sun. They are commonly seen on road and railway embankments and on walls where they sit for long periods soaking up the heat of the sun before going to find food.

They occupy a wide range of habitats including woodland, marshes, heathland, moors, sand dunes, hedgerows and bogs.

Common lizards hunt insects, spiders, snails and earthworms. They stun their prey by shaking it and then swallow it whole.

At night, and when startled, they will shelter beneath logs or stones or under other refuges that may be available.

Common lizards are protected under schedule 5 of the Wildlife and Countryside Act 1981. They received greater protection following reviews of the schedules published in 1988 and 1991. This means they are protected against intentional or recklessly killing and injuring and against sale or transporting for sale.

Common lizards should not be confused with the somewhat larger sand lizard (*Lacerta agilis*). These are typically 190mm long and stockier than the common lizard. Their marking are distinctly different being considerably more colourful. Sand lizards are confined to moorland and coastal sand dunes where they lay their eggs in the warm sand. The range of the sand lizard in the UK is therefore very limited. Sand lizards are a European protected species.

The third species of lizard is the slow worm *(Anguis fragilis)*, which is frequently mis-identified as a snake. The firm body of the slow worm is distinctly cylindrical in shape and the tiny smooth scales result in a very smooth, shiny appearance. Colouration is typically a uniform grey to brown although there is a wide variation from straw coloured to almost black and some animals have very fine stripes or a zig-zag along the centre of the back. The typical length of an adult is 400mm.

Slow worms can be found in a wide variety of habitats throughout Britain and is the most likely reptile to be found in urban and suburban environments.

Slow worms hibernate over the winter, emerging from March onwards depending upon the weather. They begin to mate in April and May and six to twelve young are born in August or September.

Their favourite food is slugs but they will also eat insects and spiders.

Slow worms are hard to find. They will bask in the sun but they quickly and quietly move into cover when disturbed and do not generally attract attention as they retreat from a basking spot.

Slow worms are also protected under schedule 5 of the Wildlife and Countryside Act 1981. They received greater protection following reviews of the schedules published in 1988 and 1991. This means they are protected against intentional or recklessly killing and injuring and against sale or transporting for sale.

Appendix VI. REPTILES – TOOLBOX TALK.

Whitcher Wildlife Ltd.
Wildlife Consultants.

Toolbox Talk : Reptiles.

Identification : Grass Snakes.

The grass snake is usually around 120cm long. The background colour is dark green and the body is marked with vertical black bars and spots that run along its sides. There is generally a yellow marking around the neck.

Identification : Adders.

The adder is the only natuve species that is venomous but it is rarely harmful to humans. Adult adders are generally up to 66cm long. Background colouration is a light shade of grey or brown with a black zigzag marking along the length of the back. As with all reptiles, colouration varies and becomes duller as sloughing (skin shedding) approaches.

Identification : Slow Worms.

Slow worms grow to around 45cm in length. The males and females display a marked difference in colour when fully grown. Females often have a dark vertebral stripe, the flanks are flecked or striped with dark brown or black, the ventral surface is nearly always uniform black. Males are more uniform in colour dorsally and on the flanks, the belly is usually mottled black or dark grey, they also have larger heads and occasionally distinct blue spots. The upper parts of the body vary from light or dark brown, grey, bronze or brick red.

Identification : Common Lizards.

Common lizards grow to around 16cm. They are grey brown to dark brown, often with a darker streak that may run the entire length of the spine. A continuous dark band bordered by light yellow or white spots is often seen on either side of the body. The underside of the males is egg yolk yellow to orange spotted with black, females are yellowish grey.

Habitat.

Maintaining the right body temperature is vital to reptiles' survival. In the morning they find a warm basking site to heat up their bodies and then later they may move back into the shade so as not to overheat. Hence, reptiles require a habitat that provides a range of suitable refugia for shelter such as dense vegetation, rubble or log piles, or crevices and open areas for basking such as bare ground, rocks or railway ballast shoulders. During hot summers reptiles may be found in damper, cooler sites.

Reptiles hibernate, spending the winter in burrows or under logs protected from the cold and predators.

When disturbed in their natural habitat reptiles will usually move away quickly.

Other Reptiles.

In addition to the reptiles outlined on this document there are also two other reptile species in Great Britain, the smooth snake and the sand lizard. These reptiles are a lot less common than the four species covered with the smooth snake being predominantly found on heathland in southern England and the sand lizard found throughout Great Britain in coastal dune areas.

These species are also afforded a higher level of protection because they are European Protected Species.

Legislation.

Reptiles are protected under schedule 5 of the Wildlife and Countryside Act 1981. They received greater protection following reviews of the schedules published in 1988 and 1991. This means they are protected against intentional or recklessly killing and injuring and against sale or transporting for sale.

DO's.

- ✓ Stop work if any reptiles are found and let them move away safely of their own accord.
- ✓ Stop work immediately if large number of reptiles are found and contact Whitcher Wildlife Ltd.
- ✓ Avoid handling reptiles where possible.
- ✓ Seek medical attention immediately if you are bitten by a snake.
- ✓ If in doubt of the species, photograph the reptile and contact Whitcher Wildlife Ltd regarding identification.

DON'Ts.

- × DON'T handle adders. Their bite is poisonous.
- × DON'T kill or injure any reptiles.
