

REPLY'S TO WASTE MANAGEMENT PLAN.

Statements are numbered 1 to 8 as your bullet points from first to last.

- 1) Small amount of waste would be generated, as whatever can be recycled / used etc. would be.
- 2) No hard separation is foreseen, however top soil and sub soil would be separated and used when required to reinstate ground levels.
- 3) No building is on site so any demolition or reuse is possible.
- 4) Again no composting is possible refer to point 2; if border shrubs are removed they would be taken to composting facilities.
- 5) Minimal raw materials would be used but where required waste would be kept to a minimum and disposed of at the appropriate place.
- 6) All residual waste that cannot be re used would be put in the appropriate containers until fully loaded, sheeted or netted and taken to appropriate recycling or waste depots.
- 7) Again raw materials would be kept to a minimum, we would look to source recycled stone / hard-core etc.in the first instance and depending on bricks these may be reusable / reclaimed bricks etc. any recyclable materials would be taken to the appropriate recycling / crushing facilities during and at the end of the development.
- 8) Monitoring would be carried out by local government officials, supplying, recycling, composting, rubbish facilities and collection services.
- 9) No on site recycling is foreseen.
- 10) However as explained separation, reuse where ever possible would be would be carried out but no crushing / grading / composting etc. would be carried out.
