

We would reduce the branch that is almost touching our property by 50% to reduce the risk of future damage as strong winds make it come even closer to the property.

I have marked this on the image to the left.

We would remove any dead branches from the tree such as the ones circled.

When they fall they are very brittle and seem rotten. This will also reduce the chance of large branches landing on our vehicles.

Side view showing size of the tree on the other side. We don't plan to touch any of this side.

We would reduce the size of the branches on this side of the tree to reduce the amount of it hanging over our front garden.

This will reduce the amount of bird excrement we get on our cars and front path.
