EXECUTIVE SUMMARY

This executive summary contains an overview of the key findings and conclusions. No reliance should be placed on any part of the executive summary until the whole of the report has been read. Other sections of the report may contain information that puts into context the findings that are summarised in the executive summary.

BRIEF

Geotechnical and Environmental Associates (GEA) has been commissioned by HL Structural Engineers, on behalf of OnSide Youth Zones, to carry out a desk study for a site off Schwabisch Gmund Way, Barnsley, S71 1BP. The purpose of the work has been to determine the history of the site, to assess the potential for contamination, to provide preliminary information on the expected ground conditions and to provide preliminary information on foundation options regarding the proposed development of the site. The proposed development comprises the construction of a new youth centre, consisting of a two-storey main facility, a sports hall and a kick pitch. Four previous investigations have been undertaken on the site and their key findings have been incorporated into this report.

DESK STUDY FINDINGS

The site history has been researched by reference to historical Ordnance Survey (OS) maps obtained from the Envirocheck database. The earliest map studied, dated 1852, shows the northern half of the site as well as the eastern edge to have been occupied by woodland / orchards with the south and east of the site being occupied by what appears to have been gardens and parkland behind Harborough Hill House. The railway station to the west of site is shown as having been present. The maps dated 1892 and 1893 show a number of small buildings along the eastern edge of the site. The 1931 map notes the site as allotment gardens and Harborough Hill House had become a club. Off site, a row of terraced houses had been built along the northern boundary of the site consistent with the current houses along Mottram Street. Boro Colliery, a drift mine, is noted approximately 160 m to the east of site, and a lamp works approximately 170 m south. Little or no change is noted on subsequent maps up to 1958 but the 1961 map shows a number of structures in the northwest of the site. The 1972 map shows that an Electricity Board Depot had been built in the northern half of the site. The club in the southeastern corner of the site also appears to have been expanded with a new building just to the west of the previous Harborough Hill House. The 1991 map shows that a number of structures had been constructed in the southwestern corner of the site as well as an electrical substation on the southern boundary. There is little or no further change of significance to the site on the maps dated up to 2006, but by 2020 the Electricity Board Depot and the club buildings had been demolished. The geological map of the area and previous investigations indicate that the site is underlain by a limited to significant thickness of made ground which is underlain by the Pennine Middle Coal Measures Formation. Groundwater is expected to be present in the Pennine Middle Coal Measures Formation at depth. The site is not within a Source Protection Zone. The South Yorkshire Mining Advisory Service reports conclude that the site is stable from deep mining subsidence. Three coal seams are shown to outcrop through the site and despite there being no records of shallow mining having taken place, the reports cannot rule out that shallow unrecorded mining may have taken place. Borehole investigations are recommended for future development to ensure that shallow workings are not present.

CONCLUSIONS

On the basis of the findings of the research carried out there is considered to be a MODERATE / LOW risk of there being a significant contamination linkage at this site, and it is anticipated that remedial works, albeit probably of limited extent, may be required. A ground investigation should be carried out to supplement the work in the previous investigations but specific to the proposed building locations and a commercial end-use. Measures to deal with any contamination can then be proposed. The ground investigation will also be required to confirm the ground conditions and to provide final parameters for foundation design and the final coal mining risk assessment.

1.0 INTRODUCTION

Geotechnical and Environmental Associates (GEA) has been commissioned by HL Structural Engineers on behalf of OnSide Youth Zones to carry out a desk study for a site off Schwabisch Gmund Way, Barnsley, S71 1BP.

The site has previously been subject to desk-based and intrusive site investigations and four previous reports have been reviewed as part of this research.

1.1 Proposed Development

The proposed redevelopment of the site comprises the construction of a new youth centre, consisting of a two-storey main facility, a sports hall and a kick pitch. Some soft landscaping will be included in the redevelopment to soften site level changes.

This report is specific to the proposed development and the advice herein should be reviewed if the development proposals are amended.

1.2 Purpose of Work

The principal technical objectives of the work carried out were as follows:

- to determine the history of the site and surrounding area, including with respect to any previous or present potentially contaminative uses;
- to research the geology and hydrogeology of the site;
- to check records of data on groundwater, surface water and other publicly available environmental data; and
- to use the information obtained in the above searches to carry out a qualitative risk assessment with respect to subsurface contamination.

1.3 Scope of Work

In order to meet the above objectives, a desk study was carried out, comprising, in summary, the following activities:

- a review of historical Ordnance Survey (OS) maps and environmental data sourced from the Envirocheck database;
- a review of readily available geological maps;
- a review of nearby GEA archive projects;
- a review of four previous investigation reports provided by HL Structural Engineers;
- provision of a report presenting and interpreting the above data, together with our advice and recommendations with respect to the proposed development.

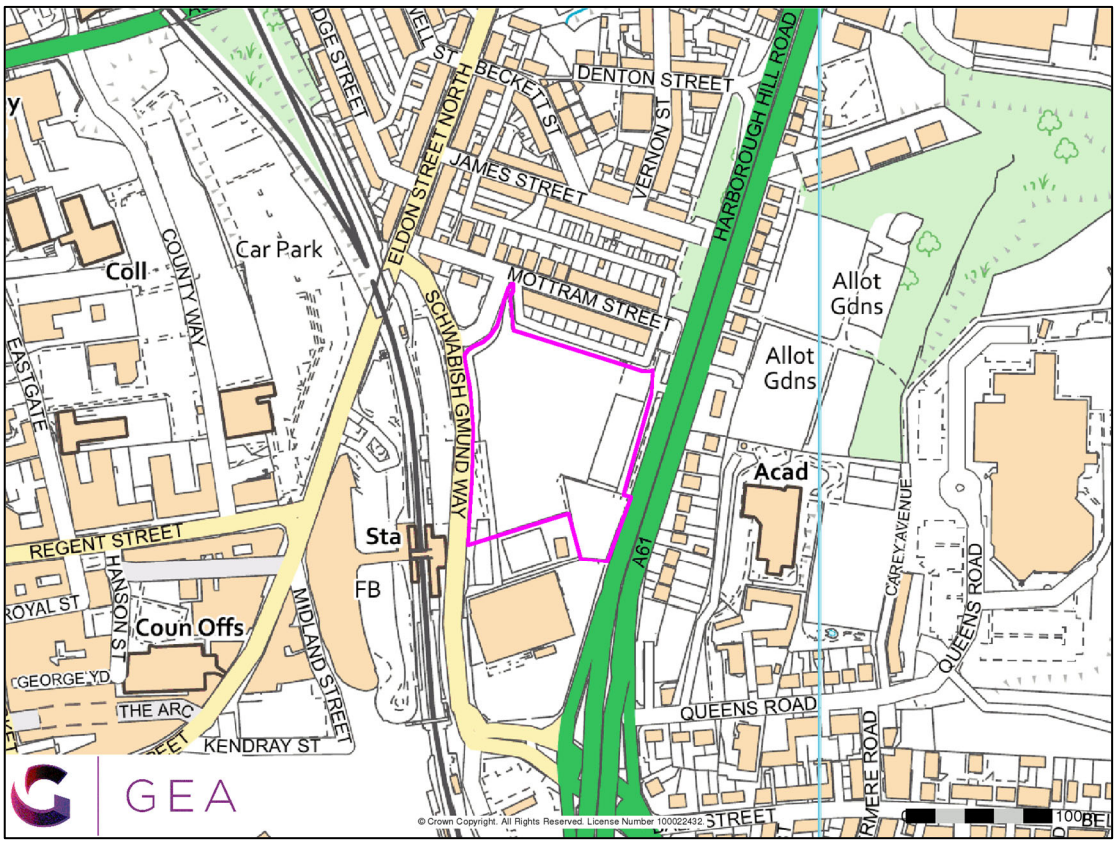

1.4 Limitations

The conclusions and recommendations made in this report are limited to those that can be made on the basis of the research carried out. The results of the research should be viewed in the context of the work that has been carried out and no liability can be accepted for matters outside the stated scope of the research. Any comments made on the basis of information obtained from third parties are given in good faith on the assumption that the information is accurate. No independent validation of third party information has been made by GEA.

2.0 THE SITE

2.1 Site Description

The site is located off Schwabisch Gmund Way approximately 25 m east of Barnsley Interchange railway station. It is bounded by Schwabisch Gmund Way to the west, Mottram Way and residential terrace houses to the north and the A61 Harborough Hill Road to the east. To the south the site is bounded by an electrical distribution station and a bingo hall with its associated car park. The site is irregular in shape with maximum dimensions of approximately 170 m north to south and 130 m west to east; its centre may be located by National Grid Reference 434815 406629. The surrounding topography slopes gently down to the north but there is a steep slope down to Schwabisch Gmund Way along the western boundary. The full site is shown on the plan below, but the proposed development is to be located in the western half or the site.

A walkover survey of the site was undertaken by a GEA engineer on 1st February 2021. The site is open and largely surfaced in concrete. There is evidence of previous buildings shown in piles of rubble, remnant walls and site scarring and there are a number of shallow ramps that

were obviously traffic routes between different levels on the site. The majority of concrete slabs appeared to be in reasonable condition, but a number were noted to have large cracks across them. At the time of the walkover the eastern roughly one-third of the site was being used for the storage of building materials, but construction did not appear to be underway on the site itself.

2.2 Site History

The site history has been researched by reference to historical Ordnance Survey (OS) maps obtained from the Envirocheck database.

The earliest map studied, dated 1852, shows the northern half of the site as well as the eastern edge to have been occupied by woodland / orchards with the south and east of the site being occupied by what appears to have been gardens and parkland behind Harborough Hill House which was located in the southeast corner of the site. The railway station to the west of site is shown as having been present as well as Harborough Hill Road. The maps dated 1892 and 1893 show a number of small buildings along the eastern edge of the site. Offsite, there are several buildings shown on the southern boundary and there is additionally a railway foundry, timber yard and sawmill shown located approximately 100 m to the southwest. In addition, goods sheds are shown approximately 110 m to the west of site. The 1906 map shows an electricity works, gas works and foundry approximately 170 m southwest of site but no change to the site itself.

The 1931 map notes the site as allotment gardens and Harborough Hill House had become a club. Off site, a row of terraced houses had been built along the northern boundary of the site consistent with the current houses along Mottram Street. Boro Colliery, as drift mine, is noted approximately 160 m to the east of site, and a lamp works approximately 170 m south. Little or no change is noted on subsequent maps up to 1958 but the 1961 map shows a number of structures in the northwest of the site. Off-site Boro Colliery is shown to have become disused; the map also shows a factory to the south of the colliery approximately 160 m east of site. The sawmill, timber yard and foundry to the southwest are shown to no longer have been present.

The 1972 map shows that an Electricity Board Depot had been built in the northern half of the site. The club in the southeastern corner of the site also appears to have been expanded with a new building just to the west of the previous Harborough Hill House. The goods sheds to the west of site is no longer shown to have been present. The 1983 map shows the former colliery site to have been used as a scrap yard. The 1991 map shows that a number of structures had been constructed in the southwestern corner of the site as well as an electrical substation on the southern boundary of the site; these structures first appeared on the 1972 map but were not labelled as such until this map.

There is little or no further change of significance to the site on the maps dated up to 2006 but by 2020 the Electricity Board Depot and the club buildings had been demolished.

2.3 Other Information

A search of public registers and databases has been made via the Envirocheck database and a summary of the results of this search is included in the Appendix. More detailed information relating to the search can be provided on request.

There are no historic landfills, licensed waste management facilities or registered waste treatment and disposal sites within 250 m of the site, the nearest historic landfill being 360 m north of the site the deposited waste noted as inert and commercial waste.

There are no Local Authority Pollution Prevention and Controls situated within 250 m of the site. There is one noted pollution incidents to controlled waters within 250 m of site, situated 195 m southeast of site. The incident occurred in 1993, the incident severity noted as Category 3 Minor incident.

There is one identified area of infilled land located (non-water) within 250 m of the site. It is located 160 m east of site and is noted as unknown filled ground (pit, quarry etc). This is considered to refer to the infilled drift mine of Boro Colliery.

Reference to records compiled by the Health Protection Agency (formerly the National Radiological Protection Board) indicates that the site falls within an area where less than 1 % of homes are affected by radon emissions and therefore radon protective measures will not be necessary.

There are no contemporary trade directory entries listed on site. Offsite, there 23 contemporary trade directory entries listed within 250 m of the site the closest being an inactive catering equipment - servicing & repairs 25 m north of site. The closest active entry is a garage service located 60 m north of site. the other entries include bus and coach operators, wrought ironworks, firefighting equipment, sewing threat manufacturers and photo and digital imaging.

The site is in a Nitrate Vulnerable Zone. The site is not located within a Source Protection Zone.

The nearest surface water feature is located 160 m southeast of the site, from the maps this appears to be a small pond to the south of a playing field. The site is not noted as being at risk from river flooding or groundwater flooding. Part of the southern half of the site is noted as being at low risk of surface water flooding.

2.4 Previous Reports

The following reports have been reviewed as part of this investigation and their key findings have been included where appropriate in Section Nos 3,4 and 5 of this report. The reports are extensive and should be read in conjunction with this report for the fullest understanding of the ground conditions and their implications.

- BWB Report Ref LDS126/01/v1 dated May 2006, is a desk based Phase 1 investigation undertaken by BWB for RWE NPower.
- BWB Report Ref LDS126/02/v1 dated September 2006, is a Phase 2 intrusive investigation following on from the above report. The investigation comprised shallow trial pits and rotary boreholes.
- Hamson Barron Smith Report Ref 23-24-19-6002/GCR1 dated July 2018. This report carried out for Barnsley Metropolitan Borough Council is entitled a Ground Conditions Report and includes a review of the two reports above.
- Met Consultancy Group Report Ref P18-01848 provided further review of the reports above and included additional boreholes and trial pits.to address limitations of the previous reports.

All of these reports included a coal mining report by South Yorkshire Mining Advisory Service (SYMAS) and reference is made to other work by Wardell Armstrong and Soil Mechanics which are understood to have been first included in the BWB reports.

The South Yorkshire Mining Advisory Service reports conclude that the site is stable from deep mining subsidence. Three coal seams are shown to outcrop through the site and despite there being no records of shallow mining having taken place, the reports cannot rule out that shallow unrecorded mining may have taken place.

Borehole investigations are recommended for future development to confirm that shallow unrecorded workings are not present. Such boreholes are likely to extend to a depth of 20 m and would be located within the footprint of the proposed buildings. Provided that these boreholes do not reveal any past shallow extraction it is not envisaged that mine grouting will be necessary for the project.

3.0 GROUND CONDITIONS

3.1 Soil Conditions

The British Geological Survey map of the area (BGS sheet87, Barnsley) indicates the site to be directly underlain by the Pennine Middle Coal Measures Formation, described as interbedded grey mudstone, siltstone, pale grey sandstone and commonly coal seams. There are no superficial deposits recorded on site.

The previous ground investigations have encountered a sensibly consistent ground profile in that beneath a limited to significant thickness of made ground, the Pennine Middle Coal Measures were encountered and proved to the maximum depth investigated.

The made ground comprised typically gravelly clay with gravel and cobbles of brick, limestone and sandstone and occasional glass, coal, polythene, ash and slag. The made ground was encountered to depths as shallow as 0.15 m and as deep as 3.2 m with a particularly deep area in the northeastern quarter of the site where shallow coal mining is considered likely to have taken place. Elevated concentrations of contaminants including PAH, TPH and metallic contaminants have been measured within the previous investigations and a ‘hot-spot’ appears to have been progressively defined by the investigations to an area in the northern part of the site.

Beneath the made ground firm, stiff and very stiff thinly laminated clay was encountered and is interpreted as being weathered mudstone. This was encountered at depths of between 0.3 m and 3.2 m and was generally found to grade into very weak to weak thinly laminated mudstones and siltstones with coal seams and sandstone layers. At least five coal seams were encountered at in the depth range of 0.3 m to 58.4 m.

3.2 Groundwater Conditions

The BGS borehole mentioned above noted seepage at 14 m. The nearest surface water feature is located 160 m southeast of the site, from the maps this appears to be a small pond to the south of a playing field.

The previous ground investigations on the site recorded minor seepage at or just below pavement sub-base at depths of between 0.7 m and 0.9 m in several of the trial pits. Deep drilling recorded ground water strikes at between 4.5 m and 29.7 m depth, rising to 4.4 m and 12.9 m respectively after 20 minutes. Subsequent groundwater monitoring has recorded groundwater levels between 5.8m and 20.0 m depth.

4.0 RISK ASSESSMENT

Consideration is being given to the redevelopment of the site which will comprises the construction of a new youth centre, consisting of a two-storey main facility, a sports hall and a kick pitch. Some soft landscaping will be installed over sloping changes in site level.

4.1 Environmental Risks

Part IIA of the Environmental Protection Act 1990, which was inserted into that Act by Section 57 of the Environment Act 1995, provides the main regulatory regime for the identification and remediation of contaminated land. As part of the regime, local authorities are required to carry out inspections of their area to identify sites that may be contaminated. The determination of contaminated sites is based on a "suitable for use" approach, which involves managing the risks posed by contaminated land by making risk-based decisions. This risk assessment is carried out on the basis of establishing one or more "pollution linkages"; a pollution linkage requires a source of contamination, a sensitive target or receptor that is at risk from the contamination and a pathway by which the contamination can travel from the source to the target.

A risk assessment should be carried out for consideration by the Local Planning Authority (LPA) before the planning application is determined. Where unacceptable risks are identified, proposals will need to be made to address these risks as part of the development process. The guidance recognises the benefits of a phased approach and the desk study is the first phase in the process of investigating and identifying contamination to assist in the determination of a planning application.

4.1.1 Source

On site sources

The desk study findings indicate a potential contaminative history in the use of the site as an Electricity Board Depot. There is a potential on any site for localised spillages and leakages of contaminants related to the operation of a site and use of vehicles. The presence of hardstanding indicates that the risk of any such occurrences entering the ground is relatively small, however, due to poor condition the hardstanding is in this may allow any residual contaminants to enter the soil.

The Department of the Environment Industrial Profile for electrical and electrical equipment manufacturing works identifies PCBs, oils, solvents, metals, acids, and alkalis as the most likely contaminants to be encountered and with the depot having been constructed in the 1970s asbestos may be present.

In addition to the theory above, the previous investigations have encountered elevated concentrations of typical industrial contaminants.

Off-site sources

The site is located directly next to an electrical substation which may be a source of contaminants such as PCB's. There have been several industrial developments within close proximity to the site, such as the railway line, a sawmill, timber yards and small factories.

There is no historic landfill noted within 250 m of the site, therefore there is no identified potential source of migrating landfill gas.

The single area of potentially infilled land noted within 250 m of the site is the disused and backfilled colliery. The South Yorkshire Mining Advisory Service 2003 report notes that it has no record of any specific mine gas migration in the vicinity of the site and the previous investigations have not measured any methane but have measured mildly elevated carbon dioxide.

4.1.2 Receptor

The proposed redevelopment of the site to a youth centre means the end users are considered to represent high sensitivity receptors.

As the site is expected to be directly underlain primarily by Secondary A Aquifer (Pennine Middle Coal Measures Formation), therefore groundwater is a potential receptor.

Buried services and site workers are considered to be sensitive receptors.

4.1.3 Pathway

The site is currently covered by the existing hardstanding which, due to its in part poor condition, would most likely form an ineffective barrier between potential contaminants in the soil.

The development proposals include the construction of a new youth centre, consisting of a two-storey main facility, a sports hall and a kick pitch. All of these will be covered with hardstanding or, in the case of the sports pitch, will include membranes and separation layers which will form a barrier between potential contaminants in the soil and the end users. In areas of soft landscaping a clean cover system will be installed.

It is also noted that the current plans for the site show only the northwestern part of the site being developed. If the rest of the site is left undeveloped any present pathways will remain.

Buried services and concrete will come into direct contact with any contaminants present in the soils through which they pass, and site workers will come into direct contact with any contaminants present in the soils handled during demolition and construction works.

4.1.4 Preliminary Risk Appraisal

In accordance with the guidelines provided by CIRIA[1], the following table comprises the conceptual site model and summarises possible pollution linkages for the site.

This method of risk evaluation involves classification of the magnitude of the potential consequence (severity) and probability (likelihood) of the risk. The method by which these factors are classified is detailed in the Appendix. On the basis of the consequence and probability the site can be attributed a level of risk, ranging from very low to very high and the procedure for making this assessment is shown in the Appendix, together with a description of each level of assessed risk and the actions that may be required to mitigate the risk.

No off-site sources of contamination have been identified which warrant further consideration.

This method of risk evaluation involves classification of the magnitude of the potential consequence (severity) and probability (likelihood) of the risk. The method by which these factors are classified is detailed in the Appendix. On the basis of the consequence and probability the site can be attributed a level of risk, ranging from very low to very high and the procedure for making this assessment is shown in the Appendix, together with a description of each level of assessed risk and the actions that may be required to mitigate the risk.

[1] Rudland, DJ, Lancefield, RM and Mayell, PN (2001) *Contaminated land risk assessment. A guide to good practice. CIRIA C552*

SOURCE	RECEPTOR	PATHWAY	PROBABILITY	CONSEQUENCE
Inorganic and organic contamination within near surface soils resulting from existing and past activities on site	End users	Ingestion of contaminated soil or dust, through skin contact or inhalation	Low likelihood	Mild
		Vapours	Low likelihood	Mild
	Vegetation	Uptake via soil through roots	Low likelihood	Mild
	Groundwater	Percolation and leaching of surface run-off	Low likelihood	Medium
	Buried services / foundation concrete	Direct contact	Low likelihood	Mild
	Site workers	Ingestion of contaminated soil or dust, skin contact, inhalation	Low likelihood	Moderate
	Adjacent sites	Surface water flow, shallow perched water or drain runs	Low likelihood	Mild

On the basis of the above, it is considered that there is a MODERATE / LOW risk of there being a significant contaminant linkage at this site that could result in any requirement for any remediation work.

The risk assessment is based on the proposed construction of a new youth centre end use of the site and being surrounded predominantly by hardstanding but with some areas fo soft landscaping. Contamination is likely to be present due to the developed history of the site and the basis of the contaminants previously measured. It would be prudent to carry out additional chemical analyses on samples of the near surface soils to assess the presence of soil contamination and to assist with waste disposal classification.

4.2 Development Issues

The proposed development comprises the construction of a new youth centre, consisting of a two-storey main facility, sports hall and a kick pitch. Loads for the new development are understood to be moderate and in the order of 700 kN to 1000 kN. Pad or strip foundations bearing in the Pennine Middle Coal Measures Formation are likely to be feasible, with allowable bearing pressures in the stiff clay likely to be in the order of 150 kN/m^2 and those formed on the weak rock could be designed for an allowable bearing pressure of 250 kN/m^2.

The previous investigations of the site show the made ground to be up to 3.2 m in depth. Excavations through this material should be possible from the findings of the previous investigations but such foundations may not prove to be economical and either piles or ground treatment such as vibro-stone columns may need to be considered. To this end, it would be prudent to consider the thickness of made ground likely to be present following site strip when final levels have been determined.

It would also be prudent to advance a small number of rotary open-hole boreholes at the corners and centre of the proposed buildings when their position has been finalised. Based on the previous reports by SYMAS, it is highly unlikely that workings will be found but since the SYMAS reports do not rule out their presence, it would be wise to investigate this matter further.

It is likely that shallow to moderate depth excavations will be able to be formed without groundwater ingress. Where the made ground is of limited thickness then it is considered that

grading, recompaction and proof testing should allow the use of ground bearing slabs. Where the made ground is thicker then treatment using vibro-stone columns will typically provide a capacity of 50 kN/m^2 for floor slabs.

A full appraisal of the contamination test results of the previous investigations undertaken in view of the locations of the proposed buildings will determine whether further testing is necessary. It would, however, be prudent to make allowance for additional contamination testing to confirm the presence and extent of any contamination and to subsequently recommend remedial action for the protection of site workers and end users, where necessary. Similarly, an allowance for six gas monitoring visits over a three month period would confirm that the previously advised Characteristic Situation 2 is appropriate for the proposed buildings when their locations have been finalised.

5.0 CONCLUSIONS

On the basis of the findings of the research carried out there is considered to be a MODERATE / LOW risk of there being a significant contamination linkage at this site, and it is anticipated that remedial works, albeit probably of limited extent, may be required.

A ground investigation should be carried out to supplement the work in the previous investigations but specific to the proposed building locations and the commercial end-use. Measures to deal with any contamination can then be proposed.

The ground investigation will also be required to confirm the ground conditions and to provide final parameters for foundation design along with finalising the coal mining risk assessment.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

GEA

Artificial Ground and Landslip

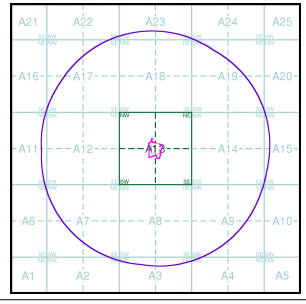

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

GEA

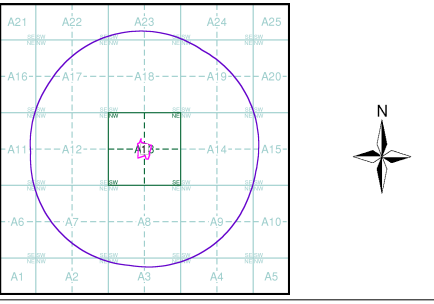

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

GEA

Bedrock and Faults

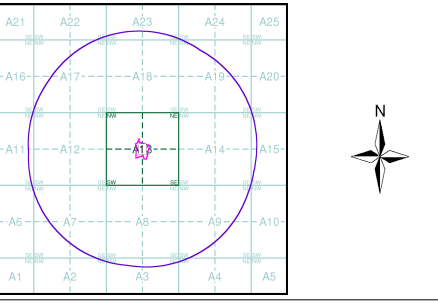

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

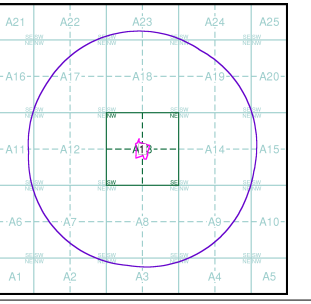

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

GEA

Yorkshire

Published 1852

Source map scale - 1:1,056

The 1:1056 scale of Ordnance Survey mapping was adopted from Ireland in 1848 and was used to survey towns with a population of over 4000, plus county towns of lesser population, in those counties mapped at the six-inch scale in 1841-55. The scale was the largest scale at which London was mapped by the Ordnance Survey and a 'skeleton' survey of the capital, showing little more than streets, street names, frontages and altitudes, was undertaken between 1848 and 1850. The majority of the 1:1056 surveys were later replaced by 1:500 surveys; although almost all the remainder were revised at this scale, sometimes more than once before 1895. The type of detail shown on the 1:1056 scale is broadly similar to that on 1:500; the apparent omission of minor details such as sewer access points and street lights may be as much a reflection of the generally earlier date of these plans, as of the specification of the map.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Yorkshire

Published 1855

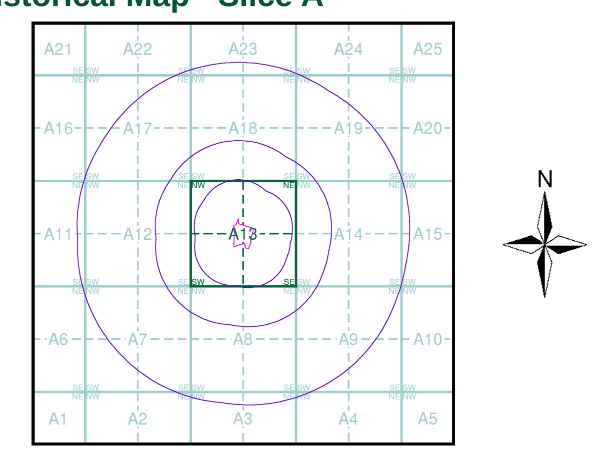

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Yorkshire

Published 1889 - 1892

Source map scale - 1:500

The 1:500 scale Ordnance Survey mapping was introduced in 1855 as a replacement for the 1:528 scale and to compliment the 1:2500 scale that had been implemented in 1853. By 1895, the 1:500 scale covered most towns over a population of about 4000 at the time of survey, although very few towns were mapped more than once at this scale, and none have been since 1910. The 1:500 scale gives particular emphasis to such features as lamp posts, man holes, arched passages and minor building projections. Also often featured are divisions between tenements, interior ground floor layouts of public buildings, and on earlier plans, the functions of the various parts of larger industrial premises are also indicated. Content of the plans does vary however, from one town to the next in terms of, for example, the completeness of railway tracks and the coverage of public buildings.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Ordnance Survey Plan

Published 1955 - 1956

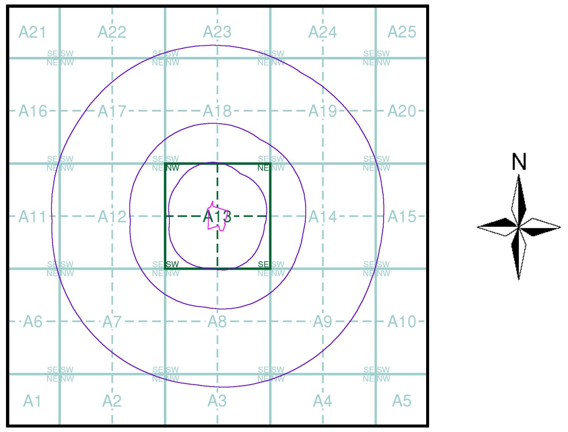

Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Large-Scale National Grid Data

Published 1993

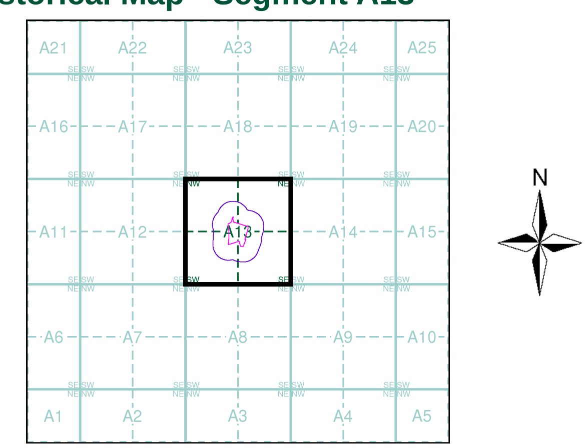

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Map Name(s) and Date(s)

10k Raster Mapping

Published 2000

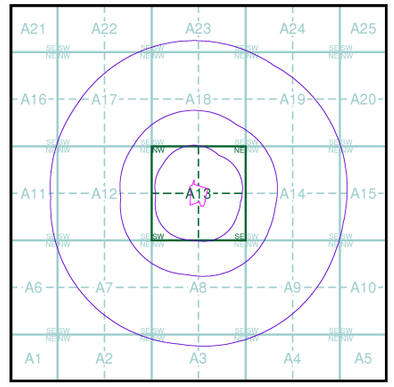

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2020

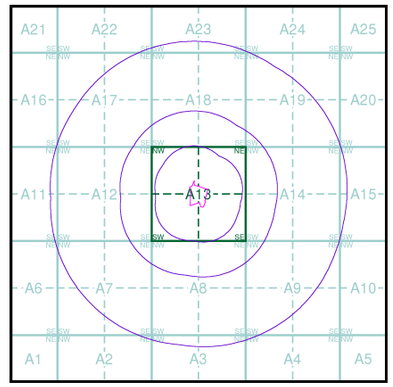

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Classification of Consequence

Classification	Definition	Examples
Severe	Short term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution (note: Water Resources Act contains no scope for considering significance of pollution) of sensitive water resource. Catastrophic damage to buildings / property. A short-term risk to a particular ecosystem, or organism forming part of such ecosystem (note: the definitions of ecological systems within the Draft Circular on Contaminated Land, DETR, 2000).	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse (can also equate to short-term human health risk if buildings are occupied).
Medium	Chronic damage to Human Health ("significant harm" as defined in DETR, 2000). Pollution of sensitive water resources (note: Water Resources Act contains no scope for considering significance of pollution). A significant change in a particular ecosystem, or organism forming part of such ecosystem (note: the definitions of ecological systems within Draft Circular on Contaminated Land, DETR, 2000).	Concentrations of a contaminant from site exceed the generic, or site-specific assessment criteria. Leaching of contaminants from a site to a major or minor aquifer Death of a species within a designated nature reserve.
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services ("significant harm" as defined in the Draft Circular of Contaminated Land, DETR, 2000). Damage to sensitive buildings / structures / services or the environment.	Pollution of non-classified groundwater Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss, or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discolouration of concrete.

Classification of Probability

Classification	Probability
High likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term, or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such an event would take place, and is less likely in the shorter term.
Unlikely	There is a pollution linkage but circumstances are such that it is improbable that an event would occur even in the very long term.

From Rudland, DJ, Lancefield, RM and Mayell, PN (2001) *Contaminated land risk assessment. A guide to good practice.* CIRIA Pub C552

Risk Assessment Matrix

		Consequence			
		Severe	***Medium***	***Mild***	***Minor***
Probability	***High likelihood***	**Very high risk**	**High risk**	**Moderate risk**	Moderate / low risk
	Likely	**High risk**	**Moderate risk**	Moderate / low risk	Low risk
	Low likelihood	**Moderate risk**	Moderate / low risk	Low risk	Very low risk
	Unlikely	Moderate / low risk	Low risk	Very low risk	Very low risk

	Description of the assessed risks and likely action required
Very high risk	There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening. This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required.
High risk	Harm is likely to arise to a designated receptor from an identified hazard. Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the longer term.
Moderate risk	It is possible that harm could arise to a designated receptor from an identified hazard. However, it is relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild. Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term.
Low risk	It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised, would at worst normally be mild.
Very low risk	There is a low possibility that harm could arise to a receptor. In the event of such harm being realised it is not likely to be severe.

From Rudland, DJ, Lancefield, RM and Mayell, PN (2001) *Contaminated land risk assessment. A guide to good practice.* CIRIA Pub C552

Geotechnical & Environmental Associates (GEA) is an engineer-led and client-focused independent specialist providing a complete range of geotechnical and contaminated land investigation, analytical and consultancy services to the property and construction industries.
