

PLANTS

1 silver birch

PLANTING SEASON BARE ROOT

Plant bare root trees between November & Mid March and containers grown ones any time of year, but preferably in autumn, winter or spring. Dig a hole handsome (width) and space (cm) deep. Add a layer of organic matter – such as compost or well-rotted manure – to the base of the hole and dig in. Place the roots in the planting hole and adjust the planting depth so that the tree is planted to the same depth as it was originally growing and the top of the roots are level with the soil surface.

Mix in more organic matter with the excavated soil and fill in the planting hole. Stake the tree with a rigid tree stake and two tree ties so that it is fully supported against the prevailing winds. Water in very well, apply a granular general feed over the soil around the tree and add a 5-10cm (2-4in) layer/mulch of well rotted garden compost or bark chippings around the mod area.

Keep well watered while the tree is establishing.

If planting on the lawn, create a turf-free circular bed around the tree with a minimum diameter of 60cm (2ft).

MAINTENANCE PLANTING ADJACENT AND UNDER TREES

Flower borders and beds, front yard, cozy & courtyard gardens, cottage & informal gardens.

5. Aucuba

One of the toughest shrubs out there! **Aucubas** are popular evergreen shrubs valued for their tolerance of full shade, dry soils, pollution and salty coastal conditions. Although plain-leaved varieties are available, the speckled yellow cultivars are the most popular and give rise to the common name 'Spotted Laurel'. The leaves are generally quite large, to 20cm (8") long, leathery and glossy in appearance making them useful for achieving a tropical look in the garden. Female plants will produce bright red berries in autumn if a male pollination partner is planted nearby. Grow Aucuba as specimen plants, for hedges or in difficult heavily-shaded corners of the garden. They will even grow well in large patio containers making a fine contrast or foil to other foliage plants and flowers.

6 Japanese maple

How to grow

Cultivation
Grow in a moist but well-drained soil. Water in summer if necessary. Leaf colour is best in partial shade, although full sun can be tolerated. Leaf scorch can be caused by lack of soil moisture or excessive exposure

Propagation
Propagate by grafting or softwood cuttings
