

I cannot see how building 1.700 new houses and an industrial estate will benefit anything to do with cutting our carbon emissions. All I can see is an increase in population and more waste products being produced due to the influx of population and use of building materials. The increase in pollution and greenhouse gasses produced can no longer be absorbed by the Green belt as there will no longer be one. So how are you going to off set this? As recent statistics state that the average house hold produces 13 tonnes of carbon per year and that equates to 22,100 tones per year for this housing project, that does not include the trading estate or any extras you may add. Unless everything is electric? Which I doubt very much. Extra emissions around the new round about, where Penny Pie Park ,was will surly make the carbon monoxide levels un-acceptable for the houses, play ground , which is far too close to the traffic,and school.
