## **1. INTRODUCTION.**

1.1. Plans are being drawn up for the demolition of the existing property at Windy Ridge, Dark Lane, Barnsley and construction of a new property on the land.

1.2. A bat survey of the site was commissioned to accompany the application for planning permission on the site.

1.3. Whitcher Wildlife Ltd carried out an initial daytime bat survey of the site on the 26<sup>th</sup> April 2016. This report outlines the findings of the survey and makes appropriate recommendations.

1.4. Appendix I of this report provides additional information on bats and the protection afforded to them and is designed to assist the reader in understanding the contents of this report.

\*\*\*\*\*

## 2. SURVEY METHODOLOGY.

2.1. The buildings were thoroughly checked internally and externally for potential bat roosting sites by looking for the following signs:-

- \* Holes, cracks or crevices.
- \* Bat droppings.
- \* Prey remains.
- \* Staining on external walls.

2.2. Unless otherwise stated, all lofts were accessed and inspected using a high powered torch and where necessary an endoscope.

2.3. A thorough external inspection was carried out from ground level for any gaps or openings in the roof and ridge tiles, behind soffits and fascias and in the walls of the structure for suitable roost access points and field signs to indicate possible use by bats.

2.4. All window cills, walls and the ground around the structure were checked for signs of bat droppings or staining to indicate possible use by bats. Where necessary, ladders were utilised to gain access within the limits of health and safety. Any access constraints encountered are outlined within the following report.

2.5. All survey work was carried out in line with Collins, J. (ed.) (2016) *Bat Surveys for Professional Ecologists: Good Practice Guidelines* (3<sup>rd</sup> edn).

2.6. This survey was carried out by Steven Whitcher MCIEEM. Since 2002 Steven has gained extensive experience in a professional capacity as an ecological consultant carrying out ecology, protected species and Phase 1 Habitat surveys. Steven's knowledge has been supplemented through the attendance of a variety of courses run by the Chartered Institute of Ecology and Environmental Management (CIEEM), the Bat Conservation Trust (BCT) and the Field Studies Council (FSC) in the relative protected species, plant species and in carrying out Phase 1 Habitat Surveys. Steven holds Natural England Survey Licences in respect of bats, great crested newts, crayfish and barn owls, CCW Survey Licences in respect of bats and great crested newts and an SNH Survey Licence in respect of bats. Steven is also a Registered Consultant with Natural England and is confined spaces trained and qualified in tree climbing and aerial rescue.

\*\*\*\*\*

### 3. SURVEY RESULTS.

#### 3.1. Data Search Results.

3.1.1. Desktop data searches for existing records of bats in the area of the site were submitted to the South Yorkshire Bat Group (SYBG) and Sheffield Biological Records Centre (SBRC).

3.1.2. SYBG hold several records of bats in the area of the site although no records specific to this property. The approximate location of the records in the area of the site is shown below.

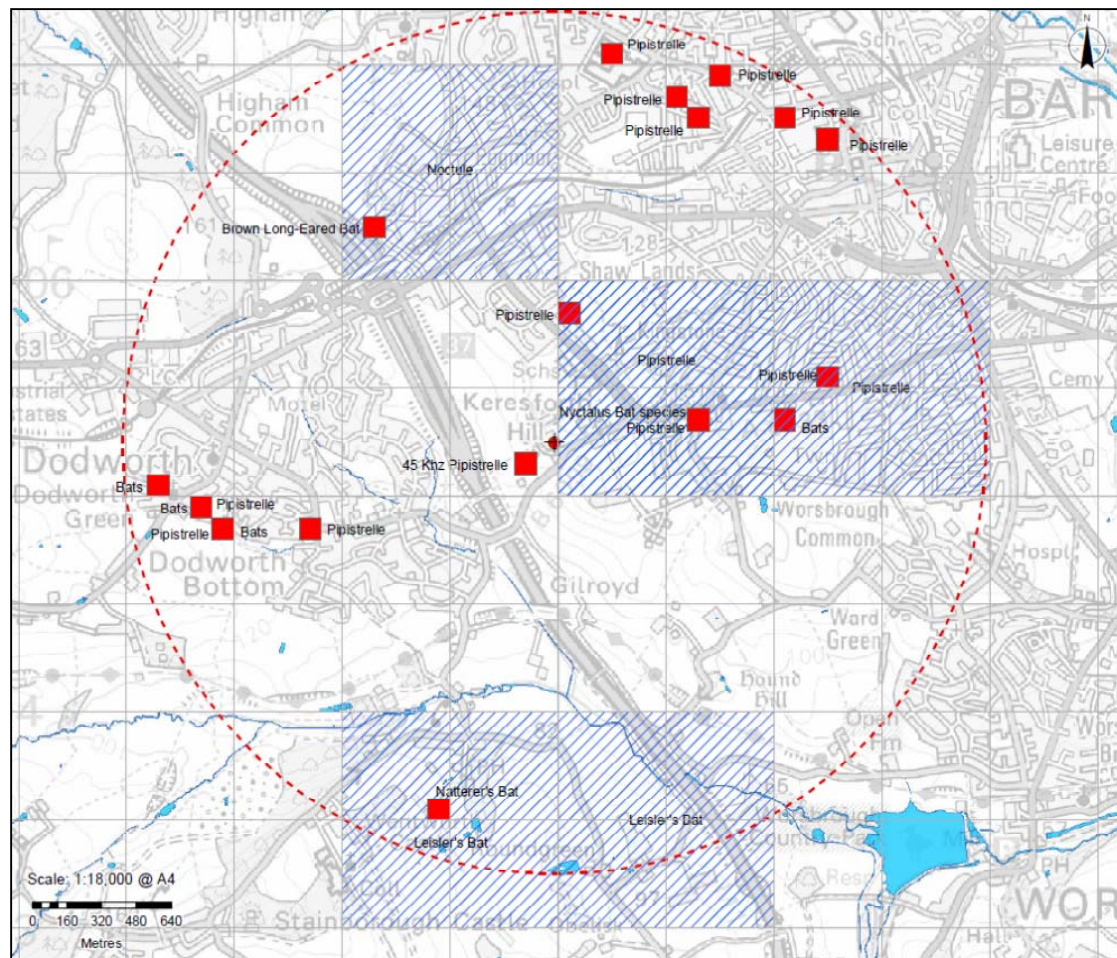

3.1.3. The closest record is of a potential Pipistrelle roost on Keresforth Hill Road at SE 328-051 from 2008, approximately 120m to the south of the site.

3.1.4. There are also further records extending into the surrounding area. A full copy of the records is included in Appendix II of this report.

3.1.5. SBRC also hold several records of bats in the area of the site. The records include records that correspond to the records returned by SYBG with additional records in some areas.

3.1.6. The map below shows the locations of the records returned by SBRC.

3.1.7. The closest record is again a record on Keresforth Hill Road, approximately 120m to the southwest of the site.

3.1.8. A full copy of the map is included in Appendix II of this report.

### 3.2. The Surveyed Area.

3.2.1. The surveyed area was Windy Ridge a residential property on Dark Lane in Barnsley, as shown below.

3.2.2. Windy Ridge is a large residential bungalow located on a south facing hillside on the southwest side of Barnsley. The property is currently disused and empty.

3.2.3. The walls of the building are brick cavity walls with the windows and doors around the building intact and sealed. Wide wooden eaves are present around the entire building.

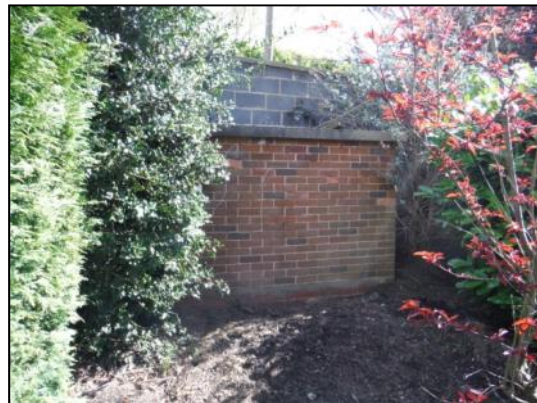

3.2.4. The roof of the building comprises a multi pitched tiled roof with three dormer windows, two in the front elevation and one in the rear. The dormer windows have small pitches above and hanging tiles on the sides.

3.2.5. Internally the rooms of the building extend into the loft space with the only accessible loft space being above the garage.

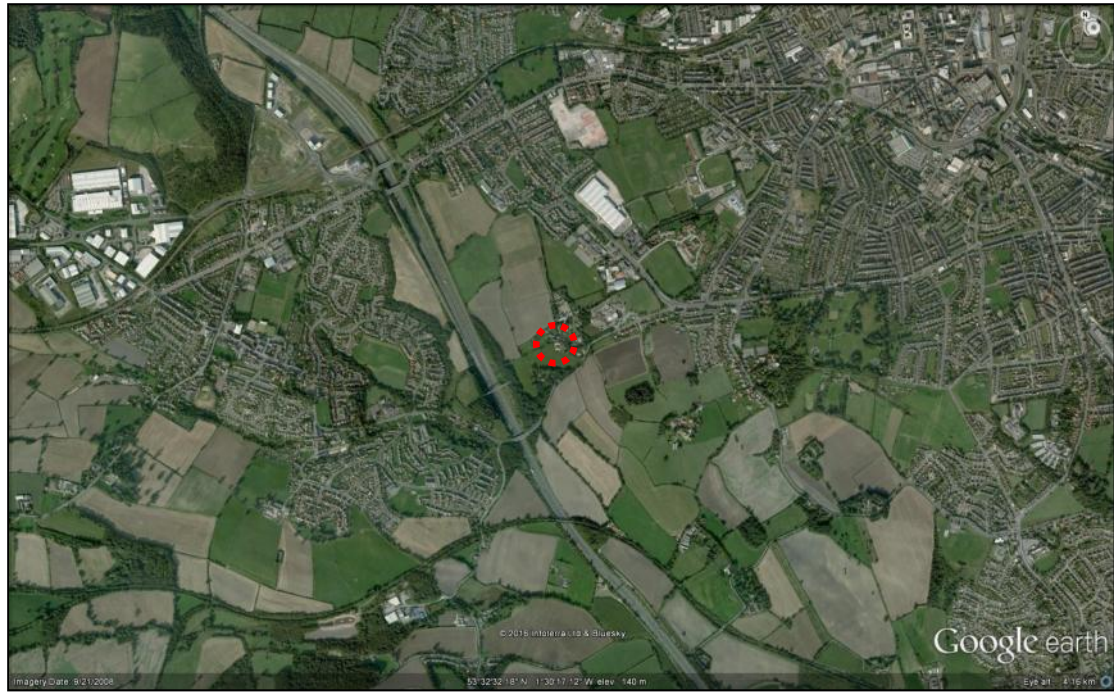

3.2.6. There are also two small outbuildings located in the land associated with the building, a prefabricated concrete garage and a small services building.

3.2.7. The buildings stand in established grounds comprising lawns, ponds, shrubs and trees.

3.2.8. The immediate surrounding area comprises residential properties to the north and east, a residential garden to the west and a grass field to the south.

3.2.9. The further surrounding area comprises farmland and residential housing to the north and east extending to the densely urban areas of Barnsley beyond. To the south and west there are areas of farmland and woodland extending to the M1 motorway with areas of farmland, woodland and small villages beyond.

### 3.3. Survey Results.

3.3.1. The walls of the building were found to be in a good condition during this survey with the only voids being a number of very narrow cracks and a hole where a vent cover has been removed.

3.3.2. The cracks were found to be too narrow to provide roosting opportunities for bats. The vent hole provides potential access to the cavity although no bat field signs

were identified around the hole or anywhere else around the exterior of the building during this survey.

3.3.3. The eaves of the building were found to be predominantly quite well fitted to the walls of the building although occasional voids into the eaves were identified around the building.

3.3.4. Some of the voids into the eaves displayed cobwebs or the shoots from vegetation that has been cut back at some time. Occasional open voids were identified into the eaves although no bat field signs were identified around the voids during this survey.

3.3.5. The roof of the building was found to be in a reasonable condition during this survey with the tiles being tight fitting and only occasional missing or slipped tiles identified.

3.3.6. The missing and slipped tiles were inspected and no bat field signs in the form of droppings or staining were identified around the voids.

3.3.7. The hanging tiles on the dormer windows were found to display occasional voids due to their nature although the tiles were in a good condition at the time of this survey.

3.3.8. Internally the loft space above the garage was found to have a purlin and rafter timber design with a bituminous liner on the inside of the tiles. The loft insulation was found to be clean with occasional mouse droppings identified but no bat droppings identified throughout the loft space.

3.3.9. Access was identified from the loft space into a void around the eaves of the building. However, this void was limited due to the construction of the building and access could not be gained throughout the space.

3.3.10. No bat field signs were identified in the accessible areas of the void.

3.3.11. Overall the main house was assessed as providing a **low** potential for roosting bats. The potential is due to occasional voids between the tiles and the lining felt, the occasional voids around the eaves of the building and the vent hole in the external wall. However, no bat field signs were identified to imply that these areas are used by bats.

3.3.12. The two outbuildings, the garage and the service building, were inspected and found to provide no suitable roosting opportunities for bats with no bat field signs identified around the buildings during this survey.

3.3.13. No trees that displayed suitable roosting opportunities for bats were identified within the land associated with the building.

3.3.14. The land around the building will provide a suitable foraging and commuting habitat for bats due to the tree lines and hedgerows located along the site boundaries and into the surrounding land, particularly to the east and west.

3.3.15. The habitat has been assessed as a medium value foraging habitat for bats although a thorough assessment of the bat foraging activity in the area of the site could not be thoroughly assessed during this daytime survey of the site.

\*\*\*\*\*

## **4. EVALUATION OF FINDINGS.**

4.1. The closest existing record of bats lies approximately 120m to the south of the site. Therefore there will be no direct impact on known bat roosts during the proposed work on site.

4.2. The Windy Ridge site comprises an old disused residential property with occasional very small outbuildings and an established garden.

4.3. The main house, Windy Ridge, was assessed as providing a low potential for roosting bats to be present. The roosting potential is due to voids between the tiles allowing potential access to the void between the tiles and lining felt, voids around the eaves allowing potential access to the eaves and a missing vent providing potential access to the cavity wall. No bat field signs were identified to imply that these areas are in use by bats. Therefore the work to demolish the existing building on the site will potentially have a high impact on bats if they use the building as a roost.

4.4. The two outbuildings, a prefabricated garage and a small brick services building, were both assessed as providing no suitable roosting opportunities for bats and no bat field signs were identified around the buildings during this survey. Therefore work to demolish the small outbuildings will not have an impact on roosting bats.

4.5. No trees that display roosting potential for bats were identified within the garden of Windy Ridge. Therefore works to demolish the building and re-develop the site will not have a direct impact on bats roosting in trees.

4.6. The land surrounding the site provides a suitable foraging and commuting habitat for bats with links to other areas of the suitable foraging and commuting habitat in the surrounding area. Although a thorough assessment of the bat foraging activity could not be carried out during a daytime survey of the site the habitat has been assessed as providing a medium value foraging habitat.

4.7. The current designs for the site are unknown, however any work that will impact on the hedgerows and tree lines along the boundary of the site may have an impact on foraging bats if they are present on the site.

4.8. The use of lighting on the site following the development could also have an impact on foraging and commuting bats if the lighting is not designed in a way that will avoid light pollution onto the surrounding habitats.

\*\*\*\*\*

## 5. RECOMMENDATIONS.

5.1. Due to the low potential for roosting bats to be present in the main house at Windy Ridge it is recommended that a further dusk emergence or dawn swarming bat survey of the building is carried out, in line with the Bat Conservation Trust Good Practice Guidelines.

5.2. The survey should be carried out between May and August by sufficient surveyors to ensure that all areas of the building are covered during the survey, which has been assessed as three surveyors.

5.3. Further recommendations should be made following the further bat survey of the site.

5.4. It is recommended that the boundaries of the site, the hedgerows and tree lines, remain unaffected by the proposed development to ensure there is no impact on foraging or commuting habitats.

5.5. It is also recommended that any lighting on the site is kept to a minimum and avoids light pollution onto the site boundaries or surrounding area.

5.6. If there is a requirement to carry out works that will impact on the boundaries of the site or a requirement for high levels of lighting on the site it is recommended that details of the works are passed to the author of this report to allow a further assessment of the potential impact on foraging or commuting bats and to establish whether further bat activity surveys are required prior to support the planning application.

## **Appendix I. BAT INFORMATION.**

It is necessary to understand a little about bats, their basic nature, ecology and legal protection in order to evaluate the findings of this report.

18 species of bat currently reside in Britain, 17 of which are known to breed here. They are extremely difficult to identify in the hand and even more so in flight.

All appear to be diminishing in numbers, probably due to shortage of food, caused by pesticides, as insects are their sole diet, and habitat change.

As their diet consists solely of insects, bats hibernate during the winter when their food source is at its most scarce. They will spend the winter in hollow trees, caves, mines and the roofs of buildings.

Certain species, particularly the pipistrelle (the commonest and most widespread British bat) can quickly adapt to manmade structures and will readily use these to roost and to rear their young.

Bats are protected under the Wildlife and Countryside Act 1981, Regulation 41 of The Conservation of Habitats and Species Regulations 2010, and the Countryside & Rights of Way Act 2000.

It is an offence to intentionally or recklessly kill, injure or capture or disturb bats or to damage, destroy or obstruct access to any place used by bats for shelter or protection.

A breeding or resting site of any bat is known as a bat roost. A bat roost is therefore any structure a bat uses for shelter or protection. Because bats tend to use the same roosts each year, legal opinion is that the roost site is protected whether or not the bats are present at that time.

Bat roosts can be identified by looking for:-

- Suitable holes, cracks and crevices.
- Bat droppings.
- Prey remains.
- By carrying out night observations using a bat detector.

Where development proposals are likely to affect a bat roost site, a licence is required from Natural England.

The person applying for that licence has to be suitably qualified and experienced in bat matters. That person is then responsible for ensuring that the measures contained in the licence are carried out.
