1) INTRODUCTION

The following calculations are for the design of a reinforced concrete mineshaft cap. Walker Ingram Associates have been advised that the shaft recorded on site is 2.75m in diameter and rockhead is approximately 0.9m below existing ground level.

The site is currently being cleared to make way for a possible future development, the details of which are unknown at the time of designing the cap. it is proposed to design the cap for the greater of load model 1 from EC1 or 33kN/m².

In addition to being assessed for the conditions indicated above, the reinforcement provided will be no less than that indicated by the Coal Authority's standard details.
